

Announcing Standard BECSys Ethernet Communications

BECS Technology is pleased to announce the implementation of Ethernet communications as the standard interface on BECSys5, BECSys7, and BECSysBW controllers. This enhances the BECSys line of water chemistry and automatic filtration controllers with true integral Ethernet connectivity, without the use of an external device.

Any PC running BECSys for Windows can access all Ethernet-equipped BECSys controllers over a local area network through this connection. Each controller will support up to 4 *simultaneous* PC connections over the Ethernet.

BECSys controllers already installed in the field can also be enhanced with this exciting new capability. Contact your factory-authorized BECSys distributor for more information, including a **special limited-time offer for converting BECSys controllers with modems to Ethernet.**

In installations that do not have a local area network, the BECSys Ethernet solution can be used to make local connections to laptops and PCs on site. BECS' factory-trained distributors can assist in this simple implementation.

Ethernet is now the default communication option on BECSys5, BECSysBW, and BECSys7 controllers. Where desired, a modem card may still be ordered in place of, or in addition to, the standard Ethernet connection.

To learn more about Ethernet communications, or any other features of BECSys controllers, please contact your local BECSys Distributor.

A list of BECSys Master Distributors is available online at www.becs.com
