

BECSys Controllers Go Wireless!

BECS Technology, Inc. is pleased to introduce the **BECSys Wi-Fi Module**, bringing wireless technology to the full line of BECSys water chemistry controllers.

Wireless technology isn't just for the more expensive controllers – and the best part is there are **no monthly recurring charges!**

The **BECSys Wi-Fi Module** brings an affordable solution to sites where it is impractical to run data connection wiring to the pump room, by communicating over existing Wi-Fi local area networks. When compared with cellular or satellite technologies that carry recurring monthly charges, the BECSys Wi-Fi Module pays for itself in a matter of months!

The BECSys Wi-Fi Module interfaces BECSys controllers to existing Wi-Fi networks by converting the BECSys controller's standard wired 100 BaseT Ethernet signal into an industry-standard Wi-Fi signal. The BECSys Wi-Fi Module utilizes advanced Power-over-Ethernet (POE) technology, which allows it to be mounted where the Wi-Fi signal is the strongest... even outdoors, up to 300' from the controller.

For more information, please contact the distributor in your area. For help finding a distributor, contact the appropriate individual listed below.

About BECS Technology

BECS Technology, Inc. has been designing and manufacturing the industry's most reliable and innovative water chemistry controllers for over 20 years. All systems are designed and manufactured in-house at the company's plant located in Saint Louis, Missouri, USA. Please visit www.becs.com for more information.
